Note : (i) This question paper is divided into Four **Sections-A, B, C and D.**

(ii) **All** questions are **compulsory**. Marks are indicated against each question.

SECTION - A (Reading)

1. Read the passage given below and answer the questions that follow-

People are seldom aware that their comfortable living depends upon the work of several thousands of persons. The first thing, for instance, almost everyone looks forward to in the morning is a hot cup of tea. This cup of tea embodies the work of thousands of people. Consider the number of things we require to prepare a cup of tea, such as clean drinking water, tea, sugar, milk, gas, burner, pot, crockery, strainer, spoon and so on. Consider first the supply of clean drinking water. In large cities this is rendered possible because of the construction of huge reservoirs at great cost and the regular maintenance of the water supply system by hundreds of workers.

Tea is grown in distant plantation and made available to the consumers through a vast network employing hundreds of workers. Consider further the machinery required for sugar mills. The production of this machinery involves long chain of processes and operations. The same argument holds good with regard to the supply of milk. The production of other items such as gas, burner, crockery, spoons etc. requires the service of hundreds of workers. And recall how agitated we are if the milk van is late in the morning.

[1]

P.T.O.

2. Read the passage given below and answer the questions that follow-

Animals are great builders, using simple materials but employing sound engineering principles. The webs of spiders provide the most vivid examples of animal structures built entirely in tension. Spider - web silk is so strong that many species of birds use it to build their nests. It has a stiffness index which is 30 times less than that of steel. Unlike steel, silk stretches to more than twice its original length before breaking. These qualities are owing to silk being a protein polymer composed of crystalline regions interspersed with legions of randomly arranged chains.

Beavers are natural engineers. They use tree branches to construct dams, the divided end being pressed into the walls: this apparently serves to collect stress from a broad area and to focuss it into a single trunk embedded in the substrata of the stream.

Constructing a very thick wall is uneconomical. Strength could also be provided to a thin wall by buttresses or by making the base wide. The nest of the termite *Amiteles Meridionalis* is more than two metres high with a wide base which tapers at the top. This ensures greater resistance to shear forces.

- (a) Who are the three engineers of nature discussed in the passage? 2
- (b) What do we learn about the webs of spiders? 1
